

# Multidisciplinary Mortality Review

**Dr R.Sivakumar**

**Consultant Physician**

**Colchester General Hospital**

# Outline

- **Background**
- **Mortality themes**
- **Areas to focus**
- **MDT mortality review**
- **Impact**

# Geography

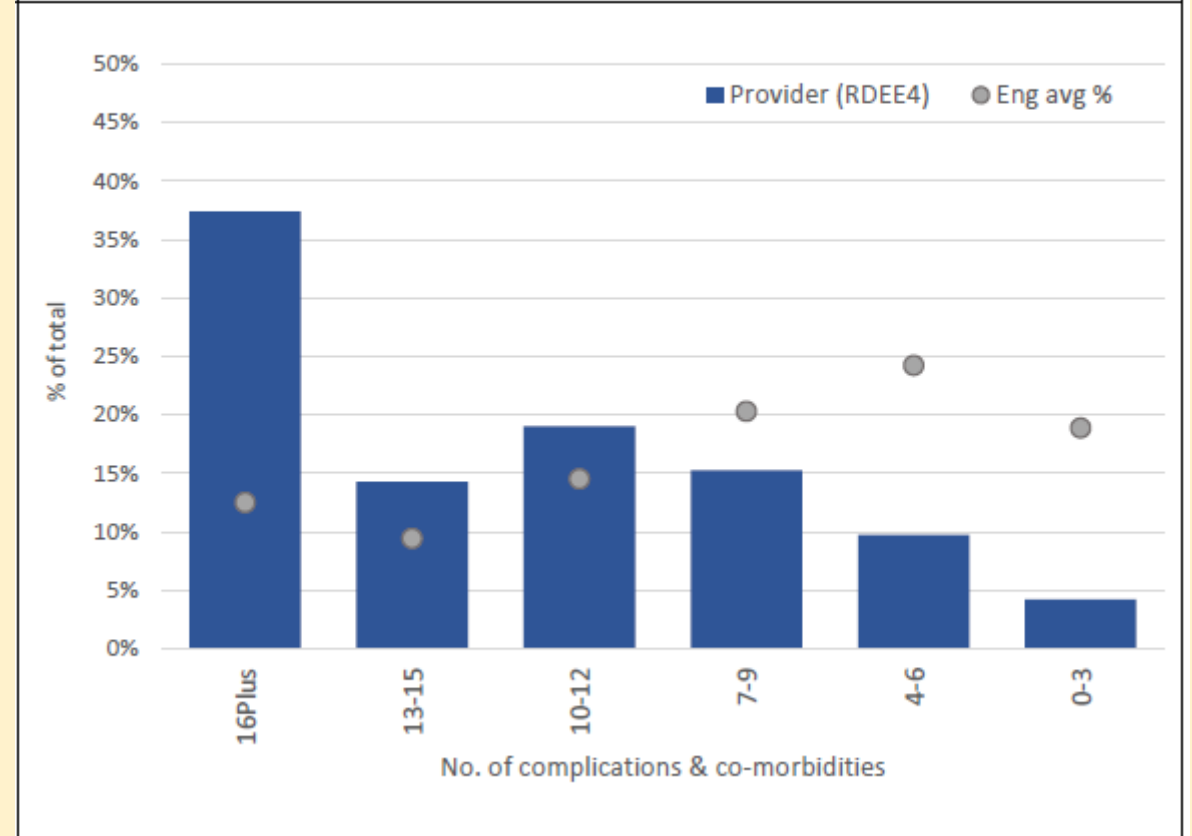

**Average frailty score**  
HES Apr 2017 - Mar 2018

- One of the most frail population as per prestroke frailty

Source: GIRFT

**Stroke by number of complications and co-morbidities**  
Source: HES Apr 2017 - Mar 2018

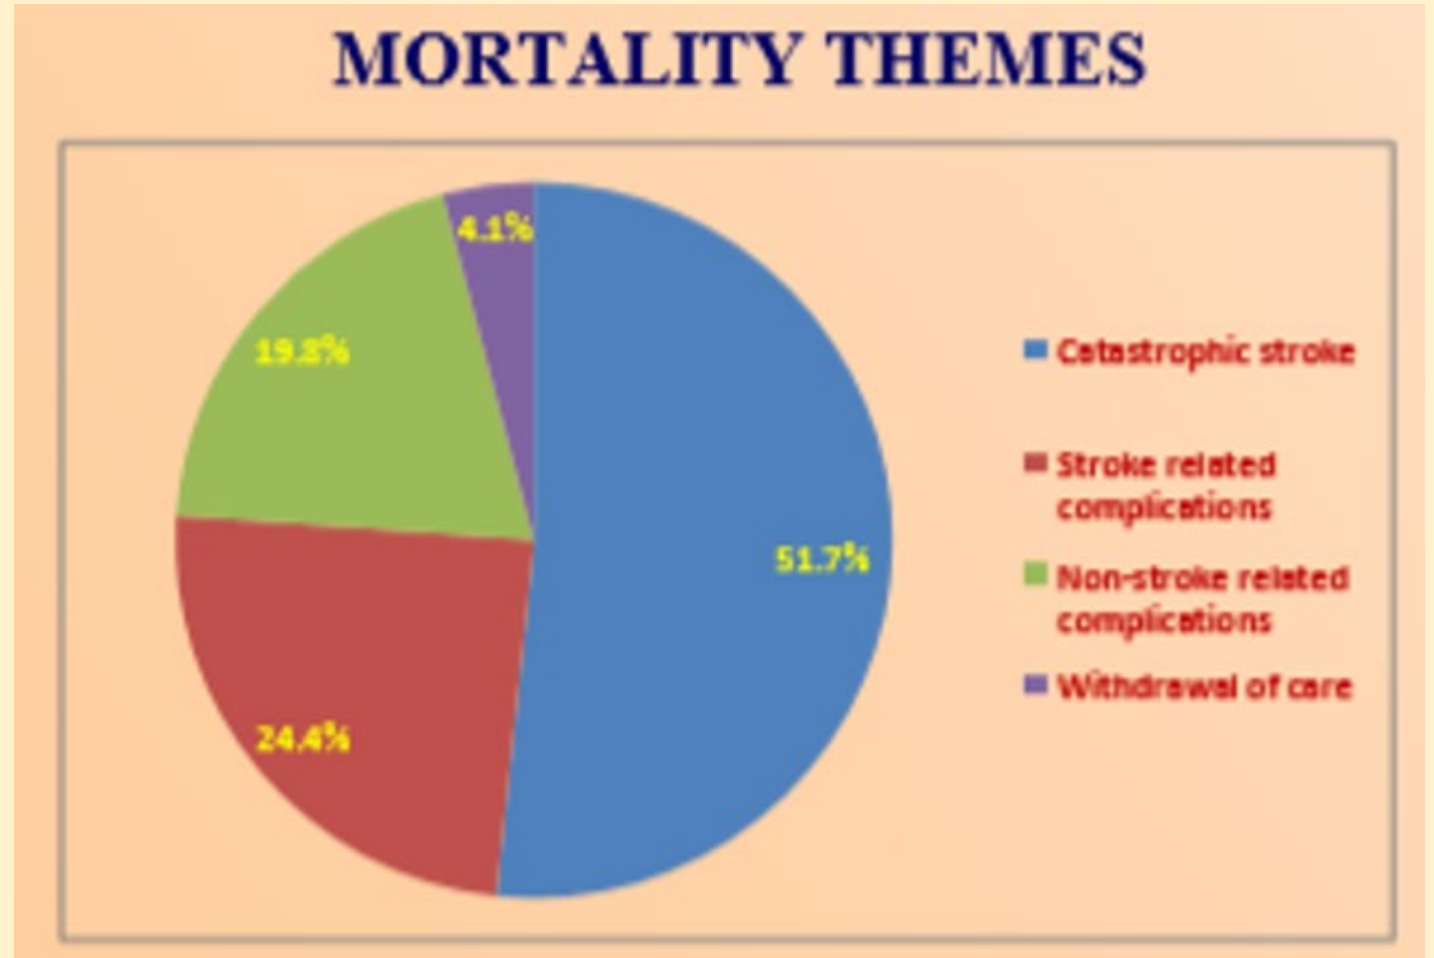

- A very high proportion of co-morbidities

Source: GIRFT

# Analysis of Mortality

- To evaluate stroke mortality and identify the themes, we carried out an audit of 170 deaths
- We also assessed the association of various factors with mortality

# Factors associated with mortality

- Many observational studies have consistently concluded that **pneumonia or development of any medical complications** are associated with mortality.
- In our multivariate analysis, only **Age** (  $p=0.05$ ), **AF** ( $P=0.0009$ ), **NIHSS** ( $p<0.0001$ ), **Haemorrhagic stroke** ( $p=0.0462$ ) and **Pneumonia** ( $p<0.0001$ ) were strongly associated with death.

**Stroke mortality form:**

Name:  Age:  Hospital number:

Premorbid status:(comorbidity especially dementia, previous stroke, CCF, functional status)

Admission details	Date of adm: <input type="text"/>	Date of Death: <input type="text"/>
Type of stroke <input type="text"/>		

Severity of stroke	<input type="text"/>
--------------------	----------------------

When was this patient fed adequately?  
 <24 hrs.  24 - 48 hrs.  48-72 hrs.  >72 hrs.  When?

Consultant review within 24 hrs: Yes/No

Did the patient develop aspiration pneumonia?  
 Yes  No  If yes? Type of feed:

What was the initial swallow assessment?

Was the patient on trials?  
 Yes  No  Details:

Did the patient develop DVT or PE?  
 Yes  No

When was thromboprophylaxis administered?  
 Not applicable

Did the patient develop sepsis due to UTI?  
 Yes  No  Catheter? Yes  No

Did the patient develop fluid overload?  
 Yes  No  On IVI? Yes  No

Did the patient develop any other medical complications?  
 Yes  No  Details:

Was there ceiling of treatment in place?  
 Yes  No

Comments:(To consider: Hgic transformation, cerebral oedema, comorbidity, expected or not; DNACPR, failure to escalate)

	<b>ACTIONS REQUIRED</b>
Is this an expected death? <b>Yes/No</b>	

**NCEPOD grading code (please circle letter)**

A – Good practice

B – Room for improvement in clinical care

C – Room for improvement in organisational care

D – Room for improvement in clinical and organisational care

E – Less than satisfactory aspects of clinical or organisational care

**How strong is the evidence that the death was preventable (please circle number)?**

1 – Definitely not preventable

2 – Slight evidence for preventability

3 – Possibly preventable but not very likely (less than 50:50 but close call)

4 – Probably preventable (more than 50:50 but close call)

5 – Strong evidence for preventability

6 – Definitely preventable

Did the patient develop aspiration pneumonia?

Yes

No

If yes? Type of feed:

What was the initial swallow assessment?

--

Was the patient on trials?

Yes

No

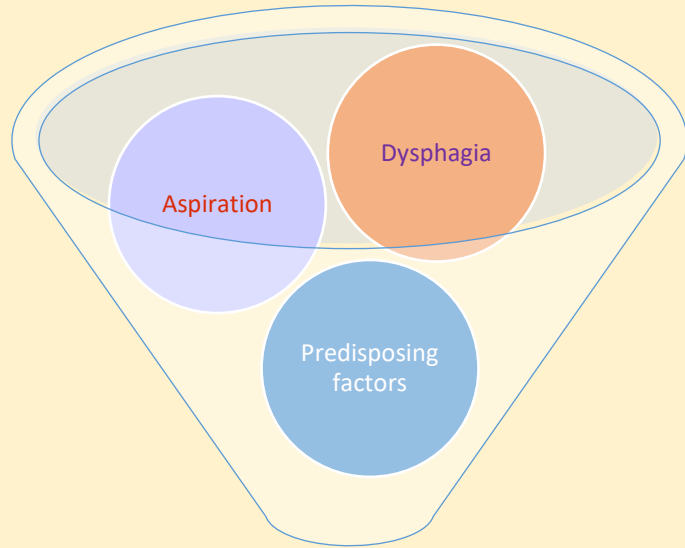

Details:

--

**Oral bacteria turns from harmless to harmful within 3 days of hospitalisation**

**Pneumonia**

**Aspiration**

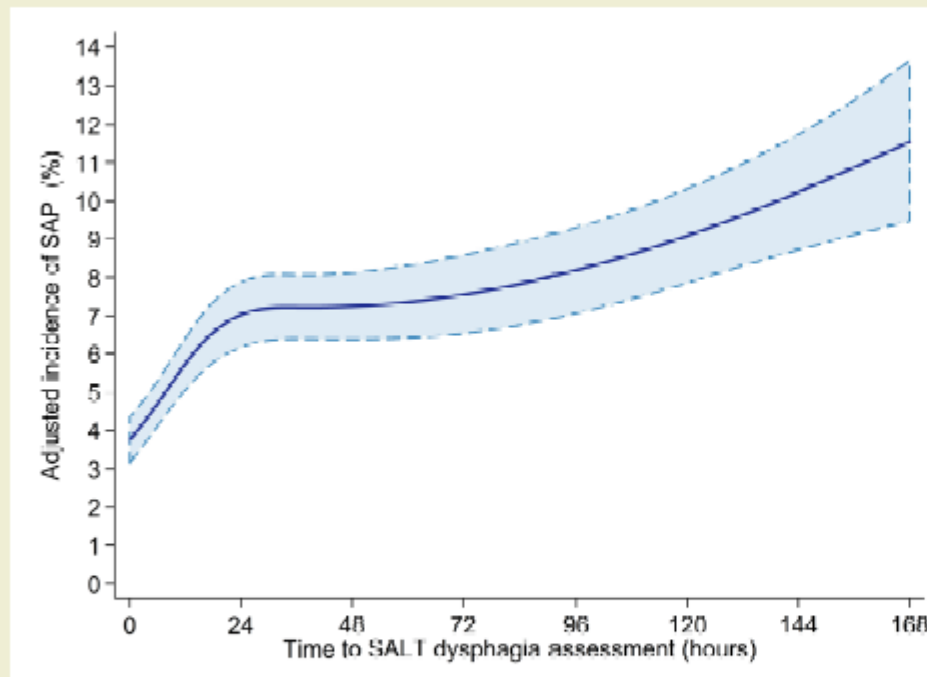

**Pneumonia:  
Increased mortality/ morbidity  
Increased length of stay**

# Improving assessment of swallowing and SLT service

## Timing of swallow assessment

Figure 3: Adjusted incidence of stroke-associated pneumonia (SAP) for increasing time to speech and language therapy assessment

This graph shows that the longer it takes for a swallow assessment to be performed for patients after stroke, the higher the risk is of developing pneumonia

These are the first data from a large multicentre national cohort to show that delays in SALT dysphagia assessment are associated with an increased risk of pneumonia after stroke. Expedited SALT dysphagia screening to avoid such delays might therefore be a strategy to reduce the risk of SAP and warrants further study

When was this patient fed adequately?

<24 hrs.	24 - 48 hrs.	48-72 hrs.	>72 hrs.	When?	
----------	--------------	------------	----------	-------	--

# Improving early nutrition

**Nutrition within 24 hrs and everyday for 72 hrs reduce mortality by 54%**

Table 3| Association between achievement of care processes and 30 day mortality

Table 3| Association between achievement of care processes and 30 day mortality

Processes	Univariable (n=36 037)		Multivariable* (n=36 037)		Multivariable*, excluding death or palliative care in first 3 days (n=27 632)	
	Odds ratio (95% CI)	P value	Odds ratio (95% CI)	P value	Odds ratio (95% CI)	P value
Seen by a stroke consultant or associate specialist within 24 hours of admission	0.77 (0.71 to 0.83)	<0.001	0.88 (0.80 to 0.97)	0.009	0.86 (0.78 to 0.96)	0.007
Brain scan within 24 hours of admission	0.89 (0.82 to 0.98)	0.01	0.96 (0.86 to 1.07)	0.49	0.91 (0.81 to 1.04)	0.16
Bundle 1: seen by nurse and one therapist within 24 hours and all relevant therapists within 72 hours	0.82 (0.76 to 0.89)	<0.001	0.90 (0.82 to 0.99)	0.028	0.91 (0.82 to 1.01)	0.089
Bundle 2: nutrition screening and formal swallow assessment within 72 hours where appropriate	0.78 (0.71 to 0.86)	<0.001	0.76 (0.67 to 0.87)	<0.0001	0.83 (0.72 to 0.96)	0.01
Bundle 3: patient's first ward of admission was stroke unit and they arrived there within four hours of hospital admission	0.96 (0.89 to 1.02)	0.19	0.99 (0.90 to 1.08)	0.75	0.95 (0.86 to 1.05)	0.31
Bundle 4: patient given antiplatelet therapy where appropriate and had adequate fluid and nutrition for first 72 hours	0.24 (0.22 to 0.26)	<0.001	0.46 (0.42 to 0.50)	<0.0001	0.55 (0.49 to 0.61)	<0.001

# **Trials**

- **Silent aspiration is a major issue**
- **Bedside assessment of swallowing –**
  - **Maximum 83% of correctly identifying dysphagia and 78% correctly identifying no dysphagia.**
- **VF and FEES not easily available.**
- **Swallowing fatigue, coexisting conditions influence the development of pneumonia**
- **Focus should be on careful monitoring of trials and early identification and treatment of pneumonia**

# Can we predict Swallowing recovery?

**Age**

0 pts Age <70 y

1 pt Age ≥70 y

---

**NIHSS score at admission**

0 pts NIHSS score ≤5 pts

1 pt NIHSS score =6-13 pts

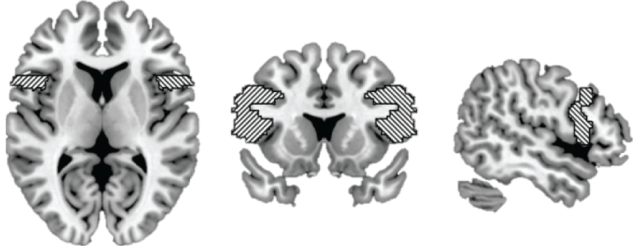

2 pts NIHSS score ≥14 pts

---

**Stroke location**

0 pts No lesion of the frontal operculum

1 pt Lesion of the frontal operculum

---

**Initial risk of aspiration**

0 pts Any 2 score =0-3 pts    Any 2 (Daniels et al<sup>22</sup>)

1 pt Any 2 score =4-5 pts     Dysphonia     Abnormal gag reflex     Cough after swallow

2 pts Any 2 score =6 pts     Dysarthria     Abnormal volitional cough     Voice change after swallow

---

**Initial impairment of oral intake**

0 pts FOIS score ≥4    FOIS (Crary et al<sup>18</sup>)

2 pts FOIS score =2-3     Level 1: nothing by mouth.     Level 5: total oral diet with multiple consistencies, but requiring special preparation or compensations.

4 pts FOIS score =1     Level 2: tube-dependent with minimal attempts of food or liquid.     Level 6: total oral diet with multiple consistencies without special preparation, but with specific food limitations.

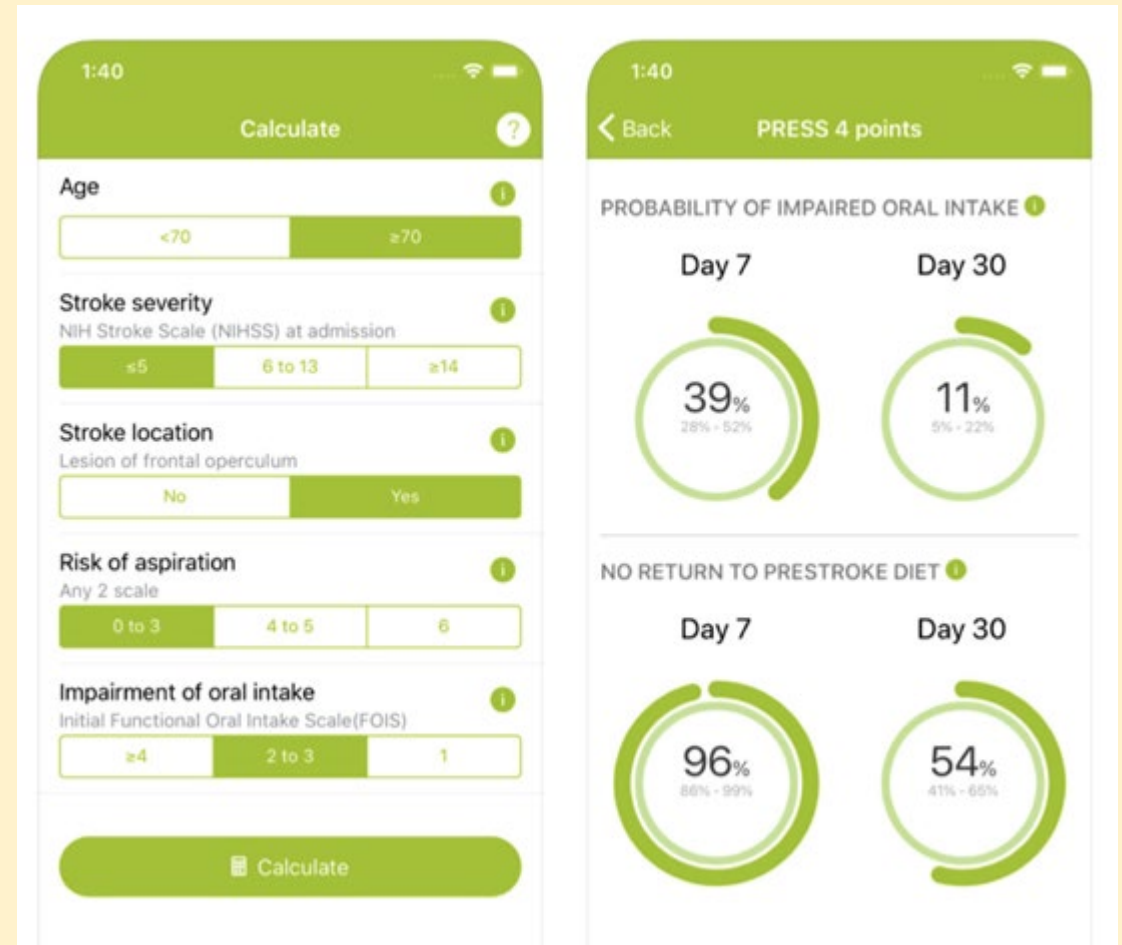

    Level 3: tube-dependent with consistent oral intake of food or liquid.     Level 7: total oral diet with no restrictions.

    Level 4: total oral diet of a single consistency.

---

**Sum**

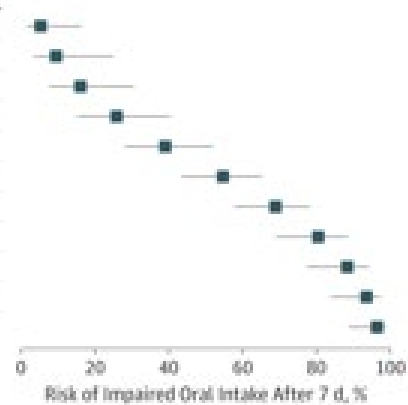

(0-10 pts)

# Prediction Estimates of Swallowing Recovery According to Predictive Swallowing Score (PRESS)

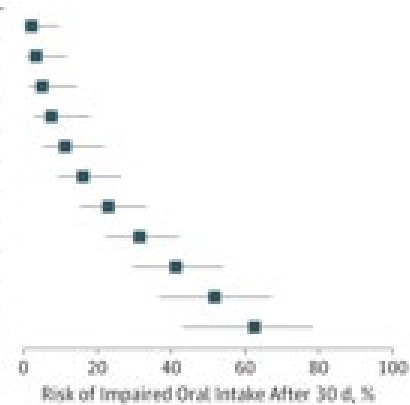

**A** Impaired oral intake after 7 d

PRESS Value	Risk Estimate (95% CI)
0	5 (2-16)
1	9 (3-23)
2	16 (7-31)
3	26 (15-40)
4	39 (28-52)
5	55 (43-65)
6	69 (58-78)
7	81 (69-89)
8	88 (77-94)
9	93 (84-97)
10	96 (89-99)

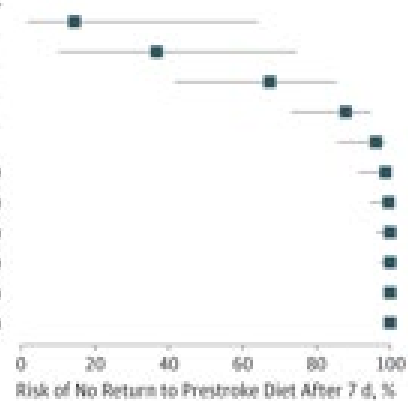

**B** Impaired oral intake after 30 d

PRESS Value	Risk Estimate (95% CI)
0	2 (0-10)
1	3 (1-12)
2	5 (2-15)
3	8 (3-18)
4	11 (5-22)
5	16 (9-27)
6	23 (15-33)
7	31 (22-42)
8	41 (30-54)
9	52 (37-67)
10	62 (43-79)

**C** No return to prestroke diet after 7 d

PRESS Value	Risk Estimate (95% CI)
0	14 (2-64)
1	37 (10-75)
2	67 (41-86)
3	88 (73-95)
4	96 (86-99)
5	99 (91-100)
6	100 (94-100)
7	100 (96-100)
8	100 (98-100)
9	100 (99-100)
10	100 (99-100)

**D** No return to prestroke diet after 30 d

PRESS Value	Risk Estimate (95% CI)
0	23 (9-47)
1	30 (15-51)
2	37 (22-56)
3	45 (31-60)
4	54 (41-65)
5	62 (51-71)
6	69 (59-78)
7	76 (65-84)
8	82 (69-90)
9	86 (73-93)
10	90 (76-96)

Did the patient develop DVT or PE?

Yes	No
-----	----

When was thromboprophylaxis administered?

	Not applicable
--	----------------

Did the patient develop sepsis due to UTI?

Yes	No	Catheter?	Yes	No
-----	----	-----------	-----	----

Did the patient develop fluid overload?

Yes	No	On IVI?	Yes	No
-----	----	---------	-----	----

Did the patient develop any other medical complications?

Yes	No	Details:
-----	----	----------

Was there ceiling of treatment in place?

Yes	No
-----	----

# Multidisciplinary mortality review

- **We started MDT mortality review in Early 2013**
- **Attended by all stroke consultants, senior nursing staff, senior therapists etc**
- **Stroke specific form was created**
- **This was much before structured judgement review introduced in 2017**
- **Emphasis on challenge around medical interventions, PEG decisions, prompt senior review, oral care, early identification of silent aspiration, fluid overload, mobilisation, suctioning etc.**

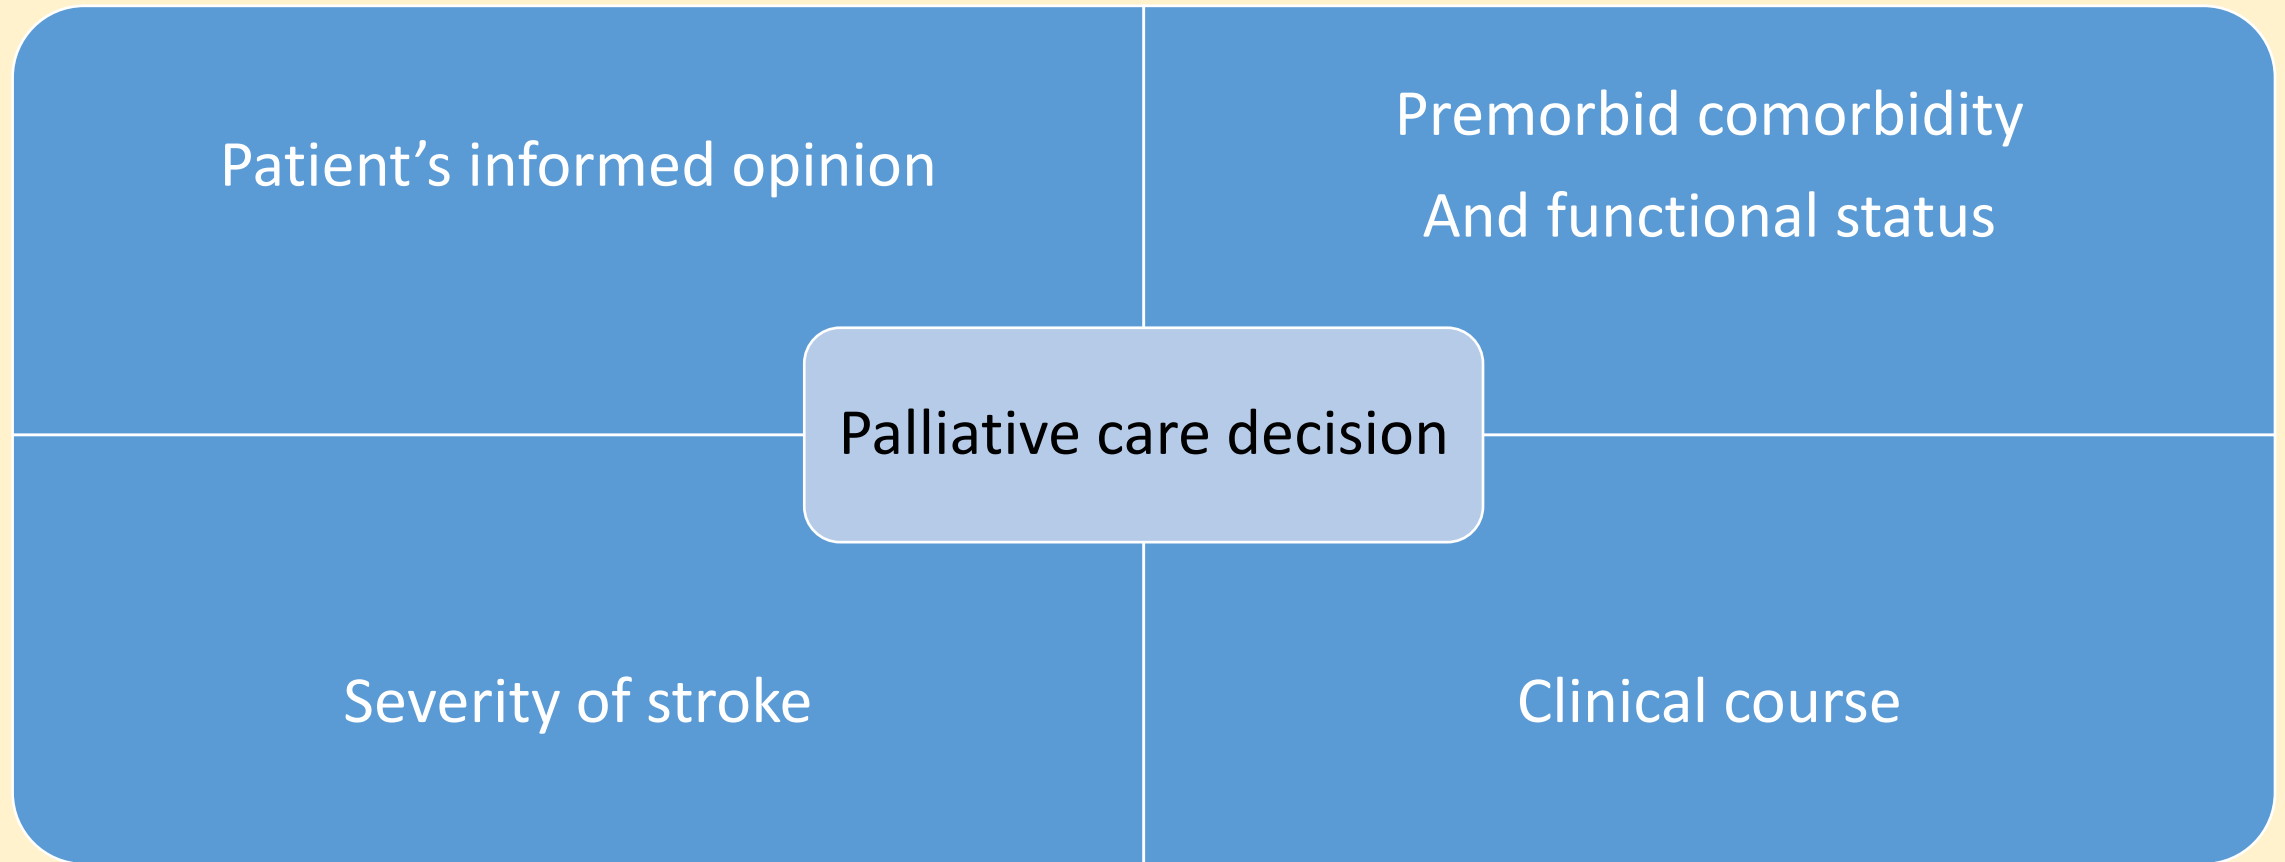

# MDT teaching

- **PEG decision making**
  - Lack of understanding of complexities
  - Distress with decisions taken
- **Series of teaching sessions organised**
- **Regular staff feedback and debrief**

# Post stroke management categories

# Palliative care – Key elements of decision making

**Decision-maker's own view on how he/she would like to be managed if they were in patient's situation has no place in patient's management**

# SUMMARY OF AREAS TO FOCUS:

- **Reducing aspiration pneumonia rates**
  - **Educating staff about aspiration pneumonia**
  - **Launch of oral care training and emodule**
  - **Trials and review**
  - **Education around Silent aspiration**
- **Improving assessment of swallowing and SLT service**
- **Improving early nutrition**
- **Early mobilisation**
- **Training of staff around decision making for withdrawal of care**
- **Multidisciplinary mortality review**

<b>Mortality Public Table -SSNAP</b>						
<b>Team name</b>	<b>19-20</b>	<b>17-19</b>	<b>16-17</b>	<b>15-16</b>	<b>14-15</b>	<b>13-14</b>
Basildon University Hospital	1.03	1.18	1.31	0.97	1.14	1.35
Addenbrooke's Hospital	1.09	1.29	1.23	0.91	1.20	1.23
<b>Colchester</b>	<b>0.79</b>	<b>0.95</b>	<b>0.82</b>	<b>1.04</b>	<b>1.10</b>	<b>1.28</b>
Ipswich Hospital	1.15	1.24	1.10	1.21	0.99	1.06
Lister Hospital	1.17	1.22	0.95	1.00	0.94	0.96
James Paget Hospital	1.06	1.29	1.33	1.09	1.28	1.33
Luton and Dunstable Hospital	1.03	1.19	1.16	1.27	1.44	1.45
Broomfield Hospital	1.02	1.11	1.06	1.02	1.44	1.38
Norwich	1.16	1.12	1.11	0.95	0.87	1.14
Peterborough City Hospital	0.81	0.77	0.96	1.11	1.14	1.08
Kings Lynn	0.94	1.03	1.04	1.13	1.14	1.27
Southend Hospital	1.05	1.07	0.92	1.01	1.03	1.48
Watford General Hospital	1.06	1.10	0.98	1.20	1.09	1.47
West Suffolk Hospital	1.01	0.89	0.92	0.80	0.86	1.23

**Standardized mortality ratio = Observed  
deaths **divided by** expected deaths**

# Summary

- **Structured stroke specific mortality review improved**
  - Process and
  - Knowledge
- **MDT staff need to be empowered to make an effective contribution to the process**
- **Is palliative decision and its timing appropriate or not?**
- **Could we have prevented deterioration?**
- **It is vital that staff are educated about decision-making process regarding palliative care decisions.**
